

# HarmonicPlanetary® HPGP High Torque Series

## Size

11, 14, 20, 32, 50, 65

6  
Sizes

## Peak Torque

12Nm – 3940Nm

## Reduction Ratio

Single Stage: 4:1 to 5:1, Two Stage: 11:1 to 45:1

## Low Backlash

Standard: <3 arc-min Optional: <1 arc-min

### Low Backlash for Life

Innovative ring gear inherently compensates for interference between meshing parts, ensuring consistent, low backlash for the life of the gearhead.

## High Efficiency

Up to 95%

## High Load Capacity Output Bearing

A Cross Roller bearing is integrated with the output flange to provide high moment stiffness, high load capacity and precise positioning accuracy.

## Easy mounting to a wide variety of servomotors

Quick Connect® coupling

\*1: Rated torque is based on life of 20,000 hours at max average input speed.

\*2: Average load torque calculated based on the application motion profile must not exceed values shown in the table. See p. 29

\*3: The limit for torque during start and stop cycles.

\*4: The limit for torque during emergency stops or from external shock loads. Always operate below this value.

\*5: Max value of average input rotational speed during operation.

\*6: Maximum instantaneous input speed.

## Performance Table

Table 020-1

Size	Ratio	Transmission Accuracy *1	Repeatability *2	Starting torque *3	Backdriving torque *4	No-load running torque *5
		arc min	arc sec	Ncm	Nm	Ncm
11	5	5	±30	4.0	0.20	5.0
	21			2.9	0.60	1.3
	37			1.6	0.60	0.90
	45			1.4	0.64	0.80
14	5	4	±20	8.6	0.43	9.8
	11			8.0	0.90	4.9
	15			7.4	1.1	2.9
	21			5.2	1.1	2.9
	33			3.3	1.1	2.0
	45			2.4	1.1	2.0
20	5	4	±15	19	0.93	28
	11			15	1.7	15
	15			12	1.8	11
	21			9.3	2.0	8.8
	33			6.4	2.1	5.9
	45			4.7	2.1	4.9
	32			5	4	±15
11		27	2.9	38		
15		25	3.7	29		
21		22	4.7	24		
33		15	4.8	14		
45		11	5.1	13		
50	5	3	±15	80	4.0	130
	11			45	5.0	60
	15			40	6.0	47
	21			36	7.6	40
	33			24	7.8	24
	45			20	8.9	20
65	4	3	±15	288	12	420
	5			240	12	360
	12			125	15	190
	15			110	17	160
	20			95	19	130
	25			84	21	110

\*1: Transmission accuracy values represent the difference between the theoretical angle and the actual angle of output for any given input. The values shown in the table are maximum values.

$\theta_{er}$  : Transmission accuracy  
 $\theta_1$  : Input angle  
 $\theta_2$  : Actual output angle  
 $R$  : Gear reduction ratio

$$\theta_{er} = \theta_2 - \frac{\theta_1}{R}$$

Figure 020-1

\*2: The repeatability is measured by moving to a given theoretical position seven times, each time approaching from the same direction. The actual position of the output shaft is measured each time and repeatability is calculated as the 1/2 of the maximum difference of the seven data points. Measured values are indicated in angles (arc-sec) prefixed with "±". The values in the table are maximum values.

Figure 020-2

\*3: Starting torque is the torque value applied to the input side at which the output first starts to rotate. The values in the table are maximum values, and are based on Z option shielded input bearing unloaded.

\*4: Backdriving torque is the torque value applied to the output side at which the input first starts to rotate. The values in the table are maximum values, and are based on Z option shielded input bearing unloaded.

Note: Never rely on these values as a margin in a system that must hold an external load. A brake must be used where back driving is not permissible.

\*5: No-load running torque is the torque required at the input to operate the gearhead at a given speed under a no-load condition. The values in the table are average values, and are based on Z option shielded input bearing unloaded at 25° C at 3,000 rpm.

# Backlash and Torsional Stiffness

### Torsional stiffness curve

With the input of the gear locked in place, a torque applied to the output flange will torsionally deflect in proportion to the applied torque. We generate a torsional stiffness curve by slowly applying torque to the output in the following sequence:

- (1) Clockwise torque to  $T_R$ , (2) Return to Zero, (3) Counter-Clockwise torque to  $-T_R$ , (4) Return to Zero and (5) again Clockwise torque to  $T_R$ .

A loop of (1) > (2) > (3) > (4) > (5) will be drawn as in Fig. 021-1.

The torsional stiffness in the region from “0.15 x  $T_R$ ” to “ $T_R$ ” is calculated using the average value of this slope. The torsional stiffness in the region from “zero torque” to “0.15 x  $T_R$ ” is lower. This is caused by the small amount of backlash plus engagement of the mating parts and loading of the planet gears under the initial torque applied.

### Calculation of total torsion angle

The method to calculate the total torsion angle (average value) in one direction when a load is applied from a no-load state.

Formula 021-1

#### ● Calculation formula

$$\theta = D + \frac{T - T_L}{A/B}$$

$\theta$	Total torsion angle	—
D	Torsion angle in one direction at output torque x 0.15 torque	See Fig. 021-1, Table 021-1, Table 021-2
T	Load torque	—
$T_L$	Output torque x 0.15 torque (= $T_R \times 0.15$ )	See Fig. 021-1, Table 021-1 to 2
A/B	Torsional stiffness	—

### Backlash (Hysteresis loss)

The vertical distance between points (2) & (4) in Fig. 021-1 is called a hysteresis loss. The hysteresis loss between “Clockwise load torque  $T_R$ ” and “Counter Clockwise load torque  $-T_R$ ” is defined as the backlash of the HPGP series. Backlash of the HPGP series is less than 3 arc-min (1 arc-min is also available).

Torque-torsion angle diagram

Figure 021-1

# HPGP-11 Outline Dimensions

Only primary dimensions are shown in the drawings below. Refer to the confirmation drawing for detailed dimensions.

Figure 022-1

## Dimension Table

(Unit: mm) Table 022-1

	Flange Type	Coupling Type	A (H7)		B	C		F (H7)		G		H <sup>*1</sup>	Mass (kg) <sup>*2</sup>

## Sizing & Selection

To fully utilize the excellent performance of the HPGP HarmonicPlanetary® gearheads, check your operating conditions and, using the flowchart, select the appropriate size gear for your application.

Check your operating conditions against the following application motion profile and select a suitable size based on the flowchart shown on the right. Also check the life and static safety coefficient of the cross roller bearing.

### Application motion profile

Review the application motion profile. Check the specifications shown in the figure below.

#### Obtain the value of each application motion profile.

Load torque	T <sub>1</sub> to T <sub>n</sub> (Nm)
Time	t <sub>1</sub> to t <sub>n</sub> (sec)
Output rotational speed	n <sub>1</sub> to n <sub>n</sub> (rpm)

#### Normal operation pattern

Starting (acceleration)	T <sub>1</sub> , t <sub>1</sub> , n <sub>1</sub>
Steady operation (constant velocity)	T <sub>2</sub> , t <sub>2</sub> , n <sub>2</sub>
Stopping (deceleration)	T <sub>3</sub> , t <sub>3</sub> , n <sub>3</sub>
Dwell	T <sub>4</sub> , t <sub>4</sub> , n <sub>4</sub>

#### Maximum rotational speed

Max. output rotational speed	n <sub>o max</sub> ≥ n <sub>1</sub> to n <sub>n</sub>
Max. input rotational speed (Restricted by motors)	n <sub>i max</sub> n <sub>1</sub> × R to n <sub>n</sub> × R
	R: Reduction ratio

#### Emergency stop torque

When impact torque is applied	T <sub>s</sub>
-------------------------------	----------------

#### Required life

L <sub>50</sub> = L (hours)
-----------------------------

### Flowchart for selecting a size

Please use the flowchart shown below for selecting a size. Operating conditions must not exceed the performance ratings.

Calculate the average load torque applied on the output side from the application motion profile: T<sub>av</sub> (Nm).

$$T_{av} = \sqrt[10/3]{\frac{|n_1| \cdot t_1 \cdot |T_1|^{10/3} + |n_2| \cdot t_2 \cdot |T_2|^{10/3} + \dots + |n_n| \cdot t_n \cdot |T_n|^{10/3}}{|n_1| \cdot t_1 + |n_2| \cdot t_2 + \dots + |n_n| \cdot t_n}}$$

Calculate the average output speed based on the application motion profile: n<sub>o av</sub> (rpm)

$$n_{o av} = \frac{|n_1| \cdot t_1 + |n_2| \cdot t_2 + \dots + |n_n| \cdot t_n}{t_1 + t_2 + \dots + t_n}$$

Make a preliminary model selection with the following condition: T<sub>av</sub> ≤ Average load torque (Refer to rating table).

OK

Determine the reduction ratio (R) based on the maximum output rotational speed (n<sub>o max</sub>) and maximum input rotational speed (n<sub>i max</sub>).

$$\frac{n_{i max}}{n_{o max}} \geq R$$

(A limit is placed on n<sub>i max</sub> by motors.)

Calculate the maximum input speed (n<sub>i max</sub>) from the maximum output speed (n<sub>o max</sub>) and the reduction ratio (R).

$$n_{i max} = n_{o max} \cdot R$$

Calculate the average input speed (n<sub>i av</sub>) from the average output speed (n<sub>o av</sub>) and the reduction ratio (R): n<sub>i av</sub> = n<sub>o av</sub> · R ≤ Max. average input speed (n<sub>r</sub>).

OK

Check whether the maximum input speed is equal to or less than the values in the rating table. n<sub>i max</sub> ≤ maximum input speed (rpm)

OK

Check whether T<sub>1</sub> and T<sub>3</sub> are within peak torques (Nm) on start and stop in the rating table.

OK

Check whether T<sub>s</sub> is less than the momentary max. torque (Nm) value from the ratings.

OK

Calculate the life and check whether it meets the specification requirement.

T<sub>r</sub>: Rated Torque

n<sub>r</sub>: Max. average input speed

$$L_{50} = 20,000 \cdot \left(\frac{T_r}{T_{av}}\right)^{10/3} \cdot \left(\frac{n_r}{n_{i av}}\right) \text{ (Hour)}$$

OK

The model number is confirmed.

Refer to the Caution note below.

Review the operation conditions, size and reduction ratio.

#### Caution

If any of the following conditions exist, please consider selecting the next larger speed reducer, reduce the operating loads or reduce the operating speed. If this cannot be done, please contact Harmonic Drive LLC. Exercise caution especially when the duty cycle is close to continuous operation.

- i) Actual average load torque (T<sub>av</sub>) > Permissible maximum value of average load torque or
- ii) Actual average input rotational speed (n<sub>i av</sub>) > Permissible average input rotational speed (n<sub>r</sub>).
- iii) Gearhead housing temperature > 70°C.

## Application sizing example

Load torque  $T_n$  (Nm)  
Time  $t_n$  (sec)  
Output rotational speed  $n_n$  (rpm)

### Normal operation pattern

Starting (acceleration)  $T_1 = 70$  Nm,  $t_1 = 0.3$  sec,  $n_1 = 60$  rpm  
Steady operation (constant velocity)  $T_2 = 18$  Nm,  $t_2 = 3$  sec,  $n_2 = 120$  rpm  
Stopping (deceleration)  $T_3 = 35$  Nm,  $t_3 = 0.4$  sec,  $n_3 = 60$  rpm  
Dwell  $T_4 = 0$  Nm,  $t_4 = 5$  sec,  $n_4 = 0$  rpm

### Maximum rotational speed

Max. output rotational speed  $n_o \max = 120$  rpm  
Max. input rotational speed  $n_i \max = 5,000$  rpm  
(Restricted by motors)

### Emergency stop torque

When impact torque is applied  $T_s = 180$  Nm

### Required life

$L_{50} = 30,000$  (hours)

Calculate the average load torque applied to the output side based on the application motion profile:  $T_{av}$  (Nm).

$$T_{av} = \sqrt[10/3]{\frac{|60\text{rpm}| \cdot 0.3\text{sec} \cdot |70\text{Nm}|^{10/3} + |120\text{rpm}| \cdot 3\text{sec} \cdot |18\text{Nm}|^{10/3} + |60\text{rpm}| \cdot 0.4\text{sec} \cdot |35\text{Nm}|^{10/3}}{|60\text{rpm}| \cdot 0.3\text{sec} + |120\text{rpm}| \cdot 3\text{sec} + |60\text{rpm}| \cdot 0.4\text{sec}}}$$

Calculate the average output speed based on the application motion profile:  $n_{av}$  (rpm)

$$n_{av} = \frac{|60\text{rpm}| \cdot 0.3\text{sec} + |120\text{rpm}| \cdot 3\text{sec} + |60\text{rpm}| \cdot 0.4\text{sec} + |0\text{rpm}| \cdot 5\text{sec}}{0.3\text{sec} + 3\text{sec} + 0.4\text{sec} + 5\text{sec}}$$

Make a preliminary model selection with the following conditions.  $T_{av} = 30.2$  Nm  $\leq 72$  Nm. (HPGP-20A-33 is tentatively selected based on the average load torque (see the rating table) of size 20 and reduction ratio of 33.)

OK

Determine a reduction ratio (R) from the maximum output speed ( $n_o \max$ ) and maximum input speed ( $n_i \max$ ).

$$\frac{5,000 \text{ rpm}}{120 \text{ rpm}} = 41.7 \geq 33$$

Calculate the maximum input speed ( $n_i \max$ ) from the maximum output speed ( $n_o \max$ ) and reduction ratio (R):  $n_i \max = 120 \text{ rpm} \cdot 33 = 3,960$  rpm

Calculate the average input speed ( $n_i av$ ) from the average output speed ( $n_{av}$ ) and reduction ratio (R):  
 $n_i av = 46.2 \text{ rpm} \cdot 33 = 1,525$  rpm  $\leq$  Max average input speed of size 20 3,000 rpm

OK

Check whether the maximum input speed is equal to or less than the values specified in the rating table.  
 $n_i \max = 3,960$  rpm  $\leq 5,000$  rpm (maximum input speed of size 20)

OK

Check whether  $T_1$  and  $T_3$  are within peak torques (Nm) on start and stop in the rating table.

$T_1 = 70$  Nm  $\leq 156$  Nm (Limit for repeated peak torque, size 20)  
 $T_3 = 35$  Nm  $\leq 156$  Nm (Limit for repeated peak torque, size 20)

OK

Check whether  $T_s$  is less than limit for momentary torque (Nm) in the rating table.  
 $T_s = 180$  Nm  $\leq 217$  Nm (momentary max. torque of size 20)

OK

Calculate life and check whether the value meets the requirement.

$$L_{50} = 20,000 \cdot \left(\frac{72 \text{ Nm}}{30.2 \text{ Nm}}\right)^{10/3} \cdot \left(\frac{3,000 \text{ rpm}}{1,525 \text{ rpm}}\right) = 712,251 \text{ (hours)} \geq 30,000 \text{ (hours)}$$

OK

The selection of model number HPGP-20A-33 is confirmed from the above calculations.

Refer to the Caution note at the bottom of page 28.

Review the operation conditions, size and reduction ratio.

# Harmonic Planetary<sup>®</sup> HPGP / HPG Series

Harmonic Drive's expertise in the field of elasto-mechanics of metals is applied to the internal gear of the HPG, HPGP and HPF Series to provide the gearhead with continuous backlash compensation. Planetary gears have simultaneous meshing between the sun gear, planet gears, and the internal ring gear. Most manufacturers try to reduce the backlash by controlling the dimensional precision of the parts. However this causes interference of meshing parts due to dimensional errors, resulting in uneven input torque, vibration, higher noise and premature wear (increase in backlash).

Harmonic Planetary<sup>®</sup> gears use a precision engineered elastic ring gear which compensates for interference between meshing parts. This proprietary Harmonic Planetary<sup>®</sup> gear design provides smooth and quiet motion and maintains ultra-low backlash for the life of the reducer.

- ◆ **Low backlash: Less than 3 arc-min (Less than 1 arc-min also available)**
- ◆ **Low gear ratios, 3:1 to 50:1**
- ◆ **High efficiency**
- ◆ **High load capacity by integrating structure with cross roller bearing**
- ◆ **High-torque capacity**

Robust cross roller bearing and output flange are integrated to provide high moment stiffness, high load capacity and precise positioning accuracy.

The cross roller bearing output flange serves as the second stage carrier for a rugged, compact design.

Backlash compensating internal gear

Shielded or sealed input bearing

Motor mounting flange

to the related product.

## Efficiency

In general, the efficiency of a speed reducer depends on the reduction ratio, input rotational speed, load torque, temperature and lubrication condition. The efficiency of each series under the following measurement conditions is plotted in the graphs on the next page. The values in the graph are average values.

### Measurement condition

Table 122-1

Input rotational speed	HPGP / HPG / HPF / HPN: 3000rpm CSG-GH / CSF-GH: Indicated on each efficiency graph.
Ambient temperature	25°C
Lubricant	Use standard lubricant for each model. (See pages 151- 152 for details.)

### Efficiency compensated for low temperature

Calculate the efficiency at an ambient temperature of 25°C or less by multiplying the efficiency at 25°C by the low-temperature efficiency correction value. Obtain values corresponding to an ambient temperature and to an input torque (TRi\*) from the following graphs when calculating the low-temperature efficiency correction value.

**HPGP**

**HPG**

**HPF**

**HPN**

\* TRi is an input torque corresponding to output torque at 25°C.

Graph 122-1

**CSG-GH**

**CSF-GH**

\* TRi is an input torque corresponding to output torque at 25°C.

## Output Shaft Bearing Load Limits

HPN Series Output Shaft Load Limits are plotted below.

HPN uses radial ball bearings to support the output shaft. Please use the curve on the graph for the appropriate load coefficient ( $f_w$ ) that represents the expected operating condition.

**Load coefficient**  
 fw=1-1.2 Smooth operation  
 without impact  
 fw=1.2-1.5 Standard operation

Output shaft speed - 100 rpm, bearing life is based on 20,000 hours. The load-point is based on shaft center of radial load and axial load.

# Output Bearing Specifications and Checking Procedure

HPGP, HPG, HPG Helical, CSF-GH, CSG-GH, HPF, and HPG-U1 are equipped with cross roller bearings. A precision cross roller bearing supports the external load (output flange). Check the maximum load, moment load, life of the bearing and static safety coefficient to maximize performance.

## Checking procedure

### (1) Checking the maximum moment load (M max)

Calculate the maximum moment load (M max). ●●▶ Maximum moment load (M max) ≤ Permissible moment (Mc)

### (2) Checking the life

Calculate the average radial load (F<sub>rav</sub>) and the average axial load (F<sub>aav</sub>). ●●▶ Calculate the radial load coefficient (X) and the axial load coefficient (Y). ●●▶ Calculate the life and check it.

### (3) Checking the static safety coefficient

Calculate the static equivalent radial load coefficient (P<sub>o</sub>). ●●▶ Check the static safety coefficient. (f<sub>s</sub>)

## Specification of output bearing

**HPGP/HPG Series** Tables 141-1, -2 and -3 indicate the cross roller bearing specifications for in-line, right angle and input shaft gears.

## How to calculate the maximum moment load

- HPGP
- HPG
- CSG-GH
- CSF-GH
- HPF

Maximum moment load ( $M_{max}$ ) is obtained as follows. Make sure that  $M_{max} \leq Mc$ .

Formula 143-1

$$M_{max} = Fr_{max}(L_r + R) + Fa_{max}La$$

$Fr_{max}$	Max. radial load	N (kgf)	See Fig. 143-1.
$Fa_{max}$	Max. axial load	N (kgf)	See Fig. 143-1.
$L_r, La$	—	m	See Fig. 143-1.
$R$	Offset amount	m	See Fig. 143-1. See "Output Bearing Specifications" of each series, p.141 & 142

- HPGP
- HPG
- CSG-GH
- CSF-GH
- HPF

The radial load coefficient (X) and the axial load coefficient (Y)

Formula 143-2

Formula	X	Y
$\frac{Fa_{av}}{Fr_{av} + 2(Fr_{av}(L_r + R) + Fa_{av} \cdot La) / dp} \leq 1.5$	1	0.45
$\frac{Fa_{av}}{Fr_{av} + 2(Fr_{av}(L_r + R) + Fa_{av} \cdot La) / dp} > 1.5$	0.67	0.67

$Fr_{av}$	Average radial load	N (kgf)	See "How to calculate the average load below."
$Fa_{av}$	Average axial load	N (kgf)	See "How to calculate the average load below."
$L_r, La$	—	m	See Fig. 143-1.
$R$	Offset amount	m	See Fig. 143-1. See "Output Bearing Specifications" of each series, p. 141 & 142.
$dp$	Circular pitch of roller	m	See Fig. 143-1. See "Output Bearing Specifications" of each series, p. 141 & 142.

## How to calculate the average load (Average radial load, average axial load, average output speed)

- HPGP
- HPG
- CSG-GH
- CSF-GH
- HPF

If the radial load and the axial load fluctuate, they should be converted into the average load to check the life of the cross roller bearing.

**How to obtain the average radial load ( $Fr_{av}$ )** Formula 143-3

$$Fr_{av} = \sqrt[10/3]{\frac{n_1 t_1 (|Fr_1|)^{10/3} + n_2 t_2 (|Fr_2|)^{10/3} + \dots + n_n t_n (|Fr_n|)^{10/3}}{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}}$$

Note that the maximum radial load within the  $t_1$  section is  $Fr_1$  and the maximum radial load within the  $t_3$  section is  $Fr_3$ .

**How to obtain the average axial load ( $Fa_{av}$ )** Formula 143-4

$$Fa_{av} = \sqrt[10/3]{\frac{n_1 t_1 (|Fa_1|)^{10/3} + n_2 t_2 (|Fa_2|)^{10/3} + \dots + n_n t_n (|Fa_n|)^{10/3}}{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}}$$

Note that the maximum axial load within the  $t_1$  section is  $Fa_1$  and the maximum axial load within the  $t_3$  section is  $Fa_3$ .

**How to obtain the average output speed ( $N_{av}$ )** Formula 143-5

$$N_{av} = \frac{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}{t_1 + t_2 + \dots + t_n}$$

## How to calculate the life HPGP HPG CSG-GH CSF-GH HPF

Calculate the life of the cross roller bearing using Formula 144-1. You can obtain the dynamic equivalent load ( $P_c$ ) using Formula 144-2.

Formula 144-1

$$L_{10} = \frac{10^6}{60 \times N_{av}} \times \left( \frac{C}{f_w \cdot P_c} \right)^{10/3}$$

<b>L<sub>10</sub></b>	Life	hour	—
<b>N<sub>av</sub></b>	Ave. output speed	rpm	See "How to calculate the ave. load."
<b>C</b>	Basic dynamic load rating	N (kgf)	See "Output Bearing Specs."
<b>P<sub>c</sub></b>	Dynamic equivalent load	N (kgf)	See Formula 144-2.
<b>f<sub>w</sub></b>	Load coefficient	—	See Table 144-1.

Formula 144-2

$$P_c = X \cdot \left( Fr_{av} + \frac{2(Fr_{av}(L_r + R) + Fa_{av} \cdot La)}{dp} \right) + Y \cdot Fa_{av}$$

<b>Fr<sub>av</sub></b>	Average radial load	N (kgf)	See "How to calculate the ave. load."
<b>Fa<sub>av</sub></b>	Average axial load	N (kgf)	
<b>dp</b>	Pitch Circle of roller	m	See "Output Bearing Specs."
<b>X</b>	Radial load coefficient	—	See "How to calculate the radial load coefficient and the axial load coefficient."
<b>Y</b>	Axial load coefficient	—	
<b>L<sub>r</sub>, La</b>	—	m	See Figure 143-1. See "External load influence diagram."
<b>R</b>	Offset amount	m	See Figure 143-1. See "External load influence diagram" and "Output Bearing Specs" of each series.

**Load coefficient** Table 144-1

Load status	f <sub>w</sub>
During smooth operation without impact or vibration	1 to 1.2
During normal operation	1.2 to 1.5
During operation with impact or vibration	1.5 to 3

## How to calculate the life during oscillating motion HPGP HPG CSG-GH CSF-GH HPF

Calculate the life of the cross roller bearing during oscillating motion by Formula 144-3.

Formula 144-3

$$L_{oc} = \frac{10^6}{60 \times n_1} \times \frac{90}{\theta} \times \left( \frac{C}{f_w \cdot P_c} \right)^{10/3}$$

<b>L<sub>oc</sub></b>	Rated life under oscillating motion	hour	—
<b>n<sub>1</sub></b>	No. of reciprocating oscillation per min.	cpm	—
<b>C</b>	Basic dynamic load rating	N (kgf)	See "Output Bearing Specs."
<b>P<sub>c</sub></b>	Dynamic equivalent load	N (kgf)	See Formula 144-2.
<b>f<sub>w</sub></b>	Load coefficient	—	See Table 144-1.
<b>θ</b>	Oscillating angle /2	Deg.	See Figure 144-1.

**Note** When it is used for a long time while the rotation speed of the output shaft is in the ultra-low operation range (0.02rpm or less), the lubrication of the bearing becomes insufficient, resulting in deterioration of the bearing or increased load in the output side. When using it in the ultra-low operation range, contact us.

## How to calculate the static safety coefficient HPGP HPG CSG-GH CSF-GH HPF

In general, the basic static load rating ( $C_0$ ) is considered to be the permissible limit of the static equivalent load. However, obtain the limit based on the operating and required conditions. Calculate the static safety coefficient ( $f_s$ ) of the cross roller bearing using Formula 144-4.

General values under the operating condition are shown in Table 144-2. You can calculate the static equivalent load ( $P_0$ ) using Formula 144-5.

Formula 144-4

$$f_s = \frac{C_0}{P_0}$$

<b>C<sub>0</sub></b>	Basic static load	N (kgf)	See "Output Bearing Specs."
<b>P<sub>0</sub></b>	Static equivalent load	N (kgf)	See Formula 144-5.

Formula 144-5

$$P_0 = Fr_{max} + \frac{2M_{max}}{dp} + 0.44Fa_{max}$$

<b>Fr<sub>max</sub></b>	Max. radial load	N (kgf)	
<b>Fa<sub>max</sub></b>	Max. axial load	N (kgf)	See "How to calculate the max. moment load."
<b>M<sub>max</sub></b>	Max. moment load	Nm (kgfm)	
<b>dp</b>	Pitch Circle	m	See "Output Bearing Specs" of each series.

**Static safety coefficient** Table 144-2

Load status	f <sub>s</sub>
When high precision is required	≥ 3
When impact or vibration is expected	≥ 2
Under normal operating condition	≥ 1.5

## Input Bearing Specifications and Checking Procedure

Check the maximum load and life of the bearing on the input side if the reducer is an HPG input shaft unit or an HPF hollow shaft unit.

### Checking procedure

HPG

HPF

#### (1) Checking maximum load

Calculate:

Maximum moment load ( $Mi_{max}$ )  
Maximum axial load ( $Fai_{max}$ )  
Maximum radial load ( $Fri_{max}$ )

Maximum moment load ( $Mi_{max}$ )  $\leq$  Allowable moment load ( $Mc$ )  
Maximum axial load ( $Fai_{max}$ )  $\leq$  Allowable axial load ( $Fac$ )  
Maximum radial load ( $Fri_{max}$ )  $\leq$  Allowable radial load ( $Frc$ )

#### (2) Checking the life

Calculate:

Average moment load ( $Mi_{av}$ )  
Average axial load ( $Fai_{av}$ )  
Average input speed ( $Ni_{av}$ )

Calculate the life and check it.

### Specification of input bearing

#### Specification of input bearing

HPG

Table 145-1

	Nm	kgfm	N	kgf	N	kgf
25	10	1.02	1538	157	522	53.2
32	19	1.93	3263	333	966	98.5

[Note: Table 145-2 and 145-4]

\*1 The allowable axial load is the value of an axial load applied along the axis of rotation.

\*2 The allowable radial load of HPG series is the value of a radial load applied at the mid-point of the input shaft.

\*3 The allowable radial load of HPG series is the value of a radial load applied to the point of 20 mm from the shaft edge (input flange edge).

## Calculating maximum moment load ON input shaft

The maximum moment load ( $M_{i max}$ ) is calculated as follows.  
Check that the following formulas are established in all circumstances:

Formula 146-1

$$M_{i max} = F_{ri max} \cdot L_{ri} + F_{ai max} \cdot L_{ai}$$

$F_{ri max}$	Max. radial load	N (kgf)	See Fig. 146-1.
$F_{ai max}$	Max. axial load	N (kgf)	See Fig. 146-1.
$L_{ri}, L_{ai}$	-----	m	See Fig. 146-1.

$$M_{i max} \leq M_c \text{ (Allowable moment load)}$$

$$F_{ai max} \leq F_{ac} \text{ (Allowable axial load)}$$

## How to calculate average load (Average moment load, average axial load, average input speed)

If moment load and axial load fluctuate, they should be converted into the average load to check the life of the bearing.

Formula 146-2

How to calculate the average moment load ( $M_{i av}$ )

$$M_{i av} = \sqrt[3]{\frac{n_1 t_1 (|M_{i1}|)^3 + n_2 t_2 (|M_{i2}|)^3 + \dots + n_n t_n (|M_{in}|)^3}{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}}$$

Formula 146-3

How to calculate the average axial load ( $F_{ai av}$ )

$$F_{ai av} = \sqrt[3]{\frac{n_1 t_1 (|F_{ai1}|)^3 + n_2 t_2 (|F_{ai2}|)^3 + \dots + n_n t_n (|F_{ain}|)^3}{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}}$$

Formula 146-4

How to calculate the average input speed ( $N_{i av}$ )

$$N_{i av} = \frac{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}{t_1 + t_2 + \dots + t_n}$$

## Calculating life of input bearing

Calculate the bearing life according to Calculation Formula 132-5 and check the life.

Formula 146-5

$$L_{10} = \frac{10^6}{60 \times N_{i av}} \times \left( \frac{C_r}{P_{ci}} \right)^3$$

$L_{10}$	Life	Hour	—
$N_{i av}$	Average input speed	rpm	See Formula 146-4
$C_r$	Basic dynamic load rating	N (kgf)	See Table 145-1 and -3
$P_{ci}$	Dynamic equivalent load	N	See Table 146-1 and -2

Table 146-1

Size	HPG	
	$P_{ci}$	
11	$0.444 \times M_{i av} + 1.426 \times F_{ai av}$	
14	$0.137 \times M_{i av} + 1.232 \times F_{ai av}$	
20	$0.109 \times M_{i av} + 1.232 \times F_{ai av}$	
32	$0.071 \times M_{i av} + 1.232 \times F_{ai av}$	
50	$0.053 \times M_{i av} + 1.232 \times F_{ai av}$

Table 146-2

Size	HPF	
	$P_{ci}$	
25	$121 \times M_{i av} + 2.7 \times F_{ai av}$	
32	$106 \times M_{i av} + 2.7 \times F_{ai av}$	

$M_{i av}$  Average moment load Nm (kgfm) See Formula 146-2  
 $F_{ai av}$  Average axial load N (kgf) See Formula 146-3

## Assembly

Assemble and mount your gearhead in accordance with these instructions to achieve the best performance. Be sure to use the recommended bolts and use a torque wrench to achieve the proper tightening torques as recommended in tables below.

### Motor assembly procedure HPGP HPG CSG-GH CSF-GH HPN

To properly mount the motor to the gearhead, follow the procedure outlined below, refer to figure 147-1

- (1) Turn the input shaft coupling and align the bolt head with the rubber cap hole.

- (2) With the speed reducer in an upright position as illustrated in the figure below, slowly insert the motor shaft into the coupling of speed reducer. Slide the motor shaft without letting it drop down. If the speed reducer cannot be positioned upright, slowly insert the motor shaft into the coupling of speed reducer, then tighten the motor bolts evenly until the motor flange and gearhead flange are in full contact. Exercise care to avoid tilting the motor when inserting it into the gear head.

#### Bolt tightening torque

Table 147-1

Bolt size	M3	M4	M5	M6	M8	M10	M12
Tightening torque	Nm	2.0	4.5	9.0	15.3	37.2	73.5
	kgfm	0.20	0.46	0.92	1.56	3.8	7.5

Caution: Always tighten the bolts to the tightening torque specified in the table above. If the bolt is not tightened to the torque value recommended slippage of the motor shaft in the shaft coupling may occur. The bolt size will vary depending on the size of the gear and the shaft diameter of the mounted motor. Check the bolt size on the confirmation drawing provided.

Two setscrews need to be tightened on size 11. See the outline dimensions on page 22 (HPGP) and page 34 (HPG standard) and page 46 (HPG helical). Tighten the screws to the tightening torque specified below.

Table 147-2

Bolt size	M3	
Tightening torque	Nm	0.69
	kgfm	0.07

- (4) Fasten the motor to the gearhead flange with bolts.

#### Bolt\* tightening torque

Table 147-3

Bolt size	M2.5	M3	M4	M5	M6	M8	M10	M12
Tightening torque	Nm	0.59	1.4	3.2	6.3	10.7	26.1	51.5
	kgfm	0.06	0.14	0.32	0.64	1.09	2.66	5.25

\* Recommended bolt: JIS B 1176 Hexagon socket head bolt, Strength: JIS B 1051 12.9 or higher

Caution: Be sure to tighten the bolts to the tightening torques specified in the table.

- (5) Insert the rubber cap provided. This completes the assembly. (Size 11: Fasten screws with a gasket in two places)

Figure 147-1

## Speed reducer assembly

HPGP
HPG
CSG-GH
CSF-GH
HPF
HPN

Some right angle gearhead models weigh as much as 60 kg. No thread for an eyebolt is provided because the mounting orientation varies depending on the customer's needs. When mounting the reducer, hoist it using a sling paying extreme attention to safety.

When assembling gearheads into your equipment, check the flatness of your mounting surface and look for any burrs on tapped holes. Then fasten the flange (Part A in the diagram below) using appropriate bolts.

Bolt\* tightening torque for flange (Part A in the diagram below)

Table 148-1

(T.I.R.\* Unit: mm)

## Lubrication

### Prevention of grease and oil leakage

#### (Common to all models)

- Only use the recommended greases.
- Provisions for proper sealing to prevent grease leakage are incorporated into the gearheads. However, please note that some leakage may occur depending on the application or operating condition. Discuss other sealing options with our applications engineers.
- When mounting the gearhead horizontally, position the gearhead so that the rubber cap in the adapter flange is facing upwards.

#### (CSG/CSF-GH Series)

- Contact us when using HarmonicDrive® CSG/CSF-GH series with the output shaft facing downward (motor on top) at a constant load or rotating continuously in one direction.

### Sealing

#### (Common to all models)

- Provisions for proper sealing to prevent grease leakage from the input shaft are incorporated into the gearhead.
- A double lip Teflon oil seal is used for the output shaft (HPGP/HPG uses a single lip seal), gaskets or o-rings are used on all mating surfaces, and non contact shielded bearings are used for the motor shaft coupling (Double sealed bearings (D type) are available as an option\*). On the CSG/CSF-GH series, non contact shielded bearing and a Teflon oil seal with a spring is used.
- Material and surface: Gearbox: Aluminum, corrosion protected roller bearing steel, carbon steel (output shaft). Adapter flange: (if provided by Harmonic Drive) high-strength aluminum or carbon steel. Screws: black phosphate. The ambient environment should not subject any corrosive agents to the above mentioned material. The product provides protection class IP 65 under the provision that corrosion from the ambient atmosphere (condensation, liquids or gases) at the running surface of the output shaft seal is prevented. If necessary, the adapter flange can be sealed by means of a surface seal (e.g. Loctite 515).

\* D type: Bearing with a rubber contact seal on both sides

#### (HPG/HPGP/HPF/HPN Series)

- Using the double sealed bearing (D type) for the HPGP/HPG series gearhead will result in a slightly lower efficiency compared to the standard product.
- An oil seal without a spring is used ON the input side of HPG series with an input shaft (HPG-1U) and HPF series hollow shaft reducer. An option for an oil seal with a spring is available for improved seal reliability, however, the efficiency will be slightly lower (available for HPF and HPG series for sizes 14 and larger).
- Do not remove the screw plug and seal cap of the HPG series right angle gearhead. Removing them may cause leakage of grease or affect the precision of the gear.

## Standard Lubricants

### HPG/HPGP/HPF/HPN Series

The standard lubrication for the HPG/HPGP/HPF/HPN series gearheads is grease.

All gearheads are lubricated at the factory prior to shipment and additional application of grease during assembly is not required.

The gearheads are lubricated for the life of the gear and do not require re-lubrication.

High efficiency is achieved through the unique planetary gear design and grease selection.

### Lubricants

**Harmonic Grease SK-2** (HPGP/HPG-14, 20, 32)  
Manufacturer: Harmonic Drive Systems Inc.

Base oil: Refined mineral oil	Consistency: 265 to 295 at 25°C
Thickening agent: Lithium soap	Dropping point: 198°C
Additive: Extreme pressure agent and other	Color: Green
Standard: NLGI No. 2	

**EPNOC Grease AP (N) 2** (HPGP/HPG-11, 50, 65/HPF-25, 32)  
Manufacturer: Nippon Oil Co.

Base oil: Refined mineral oil	Consistency: 282 at 25°C
Thickening agent: Lithium soap	Dropping point: 200°C
Additive: Extreme pressure agent and other	Color: Light brown
Standard: NLGI No. 2	

**PYRONOC UNIVERSAL 00** (HPG right angle gearhead/HPN)  
Manufacturer: Nippon Oil Co.

Base oil: Refined mineral oil	Consistency: 420 at 25°C
Thickening agent: Urea	Dropping point: 250°C or higher
Standard: NLGI No. 00	Color: Light yellow

**MULTEMP AC-P** (HPG-X-R)  
Manufacturer: KYODO YUSHI CO, LTD

Base oil: Composite hydrocarbon oil and diester	Standard: NLGI No. 2
Thickening agent: Lithium soap	Consistency: 280 at 25°C
Additive: Extreme pressure and others	Dropping point: 200°C
	Color: Black viscose

### Ambient operating temperature range: -10°C to +40°C

The lubricant may deteriorate if the ambient operating temperature is outside of recommended operating range. Please contact our sales office or distributor for operation outside of the ambient operating temperature range.

The temperature rise of the gear depends upon the operating cycle, ambient temperature and heat conduction and radiation based on the customers installation of the gear. A housing surface temperature of 70°C is the maximum allowable limit.

## CSG-GH/CSF-GH Series

The standard lubrication for the CGS-GH / CSF-GH series gearheads is grease. All gearheads are lubricated at the factory prior to shipment and additional application of grease during assembly is not necessary.

### Lubricants

**Harmonic Grease SK-1A** (Size 20, 32, 45, 65)  
 Manufacturer: Harmonic Drive Systems Inc.

This grease has been developed exclusively for HarmonicDrive® gears and is excellent in durability and efficiency compared to commercial general-purpose grease.

Base oil: Refined mineral oil  
 Thickening Agent: Lithium soap  
 Additive: Extreme pressure agent and other  
 Standard: NLGI No. 2

Consistency: 265 to 295 at 25°C  
 Dropping point: 197°C  
 Color: Yellow

**Harmonic Grease SK-2** (Size 14)

Manufacturer: Harmonic Drive Systems Inc.

This grease has been developed exclusively for smaller sized HarmonicDrive® gears and allows smooth wave generator rotation.

Base oil: Refined mineral oil  
 Thickening Agent: Lithium soap  
 Additive: Extreme pressure agent and other  
 Standard: NLGI No. 2

Consistency: 265 to 295 at 25°C  
 Dropping point: 198°C  
 Color: Green

### Ambient operating temperature range: -10°C to +40°C

The lubricant may deteriorate if the ambient operating temperature is outside the recommended temperature range. Please contact our sales office or distributor for operation outside of the ambient operating temperature range.

The temperature rise of the gear depends upon the operating cycle, ambient temperature and heat conduction and radiation based on the customers installation of the gear. A housing surface temperature of 70°C is the maximum allowable limit.

### When to change the grease

The life of the Harmonic Drive® gear is affected by the grease performance. The grease performance varies with temperature and deteriorates at elevated temperatures. Therefore, the grease will need to be changed sooner than usual when operating at higher temperatures. The graph on the right indicates when to change the grease based upon the temperature (when the average load torque is less than or equal to the rated output torque at 2000 rpm). Also, using the formula below, you can calculate when to change the grease when the average load torque exceeds the rated output torque (at 2000 rpm).

**Formula to calculate the grease change interval when the average load torque exceeds the rated torque** Formula 152-1

$$L_{GT} = L_{GTn} \times \left( \frac{T_r}{T_{av}} \right)^3$$

**Formula symbols** Table 152-1

$L_{GT}$	Grease change interval when $T_{av} > T_r$	Input rotations	_____
$L_{GTn}$	Grease change interval when $T_{av} \leq T_r$	Input rotations	See Graph 152-1
$T_r$	Output torque at 2000 rpm	Nm, kgfm	See the "Rating table" on pages 77 & 87.
$T_{av}$	Average load torque	Nm, kgfm	Calculation formula: See page 100.

**When to change the grease:**  
**LG<sub>Tn</sub> (when the average load torque is equal to or less than the rated output torque at 2000 rpm)**

Figure 152-1

\* L10 Life of wave generator bearing

**Reference values for grease refill amount** Table 152-2

Size	14	20	32	45	65
Amount: g	0.8	3.2	6.6	11.6	78.6

### Precautions when changing the grease

Strictly observe the following instructions when changing the grease to avoid problems such as grease leakage or increase in running torque.

- Note that the amount of grease listed in Table 152-2 is the amount used to lubricate the gear at assembly. This should be used as a reference. Do not exceed this amount when re-greasing the gearhead.
- Remove grease from the gearhead and refill it with the same quantity. The adverse effects listed above normally do not occur until the gear has been re-greased 2 times. When re-greasing 3 times or more, it is essential to remove grease (using air pressure or other means) before re-lubricating with the same amount of grease that was removed.

## Warranty

Please contact us or visit our website at [www.harmonicdrive.net](http://www.harmonicdrive.net) for warranty details for your specific product.

All efforts have been made to ensure that the information in this catalog is complete and accurate. However, Harmonic Drive LLC is not liable for any errors, omissions or inaccuracies in the reported data. Harmonic Drive LLC reserves the right to change the product specifications, for any reason, without prior notice. For complete details please refer to our current Terms and Conditions posted on our website.

## Disposal

When disposing of the product, disassemble it and sort the component parts by material type and dispose of the parts as industrial waste in accordance with the applicable laws and regulations. The component part materials can be classified into three categories.

- (1) Rubber parts: Oil seals, seal packings, rubber caps, seals of shielded bearings on input side (D type only)
- (2) Aluminum parts: Housings, motor flanges
- (3) Steel parts: Other parts

## Trademark

HarmonicDrive® is a registered trademark of Harmonic Drive LLC.

HarmonicPlanetary® is a registered trademark of Harmonic Drive LLC.

# Safety

 **Warning** : Means that improper use or handling could result in a risk of death or serious injury.

 **Caution** : Means that improper use or handling could result in personal injury or damage to property.

## Application Restrictions

**This product cannot be used for the following applications:**

- \* Space flight hardware
- \* Aircraft equipment
- \* Nuclear power equipment
- \* Equipment and apparatus used in residential dwellings
- \* Vacuum environments
- \* Automotive equipment
- \* Personal recreation equipment
- \* Equipment that directly works on human bodies
- \* Equipment for transport of humans
- \* Equipment for use in a special environment
- \* Medical equipment

Please consult Harmonic Drive LLC beforehand if intending to use one of our product for the aforementioned applications.

Fail-safe devices that prevent an accident must be designed into the equipment when the products are used in any equipment that could result in personal injury or damage to property in the event of product failure.

Design Precaution: Be certain to read the catalog when designing the equipment.	
 <b>Caution</b>	<p><b>Use only in the proper environment.</b></p> <ul style="list-style-type: none"> <li>● Please ensure to comply with the following environmental conditions:               <ul style="list-style-type: none"> <li>• Ambient temperature 0 to 40°C</li> <li>• No splashing of water or oil</li> <li>• Do not expose to corrosive or explosive gas</li> <li>• No dust such as metal powder</li> </ul> </li> </ul>
 <b>Caution</b>	<p><b>Install the equipment properly.</b></p> <ul style="list-style-type: none"> <li>● Carry out the assembly and installation precisely as specified in the catalog.</li> <li>● Observe our recommended fastening methods (including bolts used and tightening torques).</li> <li>● Operating the equipment without precise assembly can cause problems such as vibration, reduction in life, deterioration of precision and product failure.</li> </ul>
 <b>Caution</b>	<p><b>Install the equipment with the required precision.</b></p> <ul style="list-style-type: none"> <li>● Design and assemble parts to keep all catalog recommended tolerances for installation.</li> <li>● Failure to hold the recommended tolerances can cause problems such as vibration, reduction in life, deterioration of precision and product failure.</li> </ul>
 <b>Caution</b>	<p><b>Use the specified lubricant.</b></p> <ul style="list-style-type: none"> <li>● Using other than our recommended lubricant can reduce the life of the product. Replace the lubricant as recommended.</li> <li>● Gearheads are factory lubricated. Do not mix installed lubricant with other kinds of grease.</li> </ul>

Operational Precaution: Be certain to read the catalog before operating the equipment.	
 <b>Caution</b>	<p><b>Use caution when handling the product and parts.</b></p> <ul style="list-style-type: none"> <li>● Do not hit the gear or any part with a hammer.</li> <li>● If you use the equipment in a damaged condition, the gearhead may not perform to catalog specifications. It can also cause problems including product failure.</li> </ul>
 <b>Caution</b>	<p><b>Operate within the allowable torque range.</b></p> <ul style="list-style-type: none"> <li>● Do not apply torque exceeding the momentary peak torque. Applying excess torque can cause problems such as loosened bolts, generation of backlash and product failure.</li> <li>● An arm attached directly to the output shaft that strikes a solid object can damage the arm or cause the output of the gearhead to fail.</li> </ul>
 <b>Caution</b>	<p><b>Do not alter or disassemble the product or parts.</b></p> <ul style="list-style-type: none"> <li>● Harmonic Planetary® and Harmonic Drive® products are manufactured as matched sets. Catalog ratings may not be achieved if the component parts are interchanged.</li> </ul>
 <b>Caution</b>	<p><b>Do not disassemble the products.</b></p> <ul style="list-style-type: none"> <li>● Do not disassemble and reassemble the products. Original performance may not be achieved.</li> </ul>
 <b>Warning</b>	<p><b>Do not use your finger to turn the gear.</b></p> <ul style="list-style-type: none"> <li>● Do not insert your finger into the gear under any circumstances. The finger may get caught in the gear causing an injury.</li> </ul>
 <b>Caution</b>	<p><b>Stop operating the system if any abnormality occurs.</b></p> <ul style="list-style-type: none"> <li>● Shut down the system promptly if any abnormal sound or vibration is detected, the rotation has stopped, an abnormally high temperature is generated, an abnormal motor current value is observed or any other anomalies are detected. Continuing to operate the system may adversely affect the product or equipment.</li> <li>● Please contact our sales office or distributor if any anomaly is detected.</li> </ul>
 <b>Warning</b>	<p><b>Large sizes (45, 50 and 65) are heavy. Use caution when handling.</b></p> <ul style="list-style-type: none"> <li>● They are heavy and may cause a lower-back injury or an injury if dropped on a hand or foot. Wear protective shoes and back support when handling the product.</li> </ul>
 <b>Caution</b>	<ul style="list-style-type: none"> <li>● Rust-proofing was applied before shipping. However, please note that rusting may occur depending on the customers' storage environment.</li> <li>● Although black oxide finish is applied to some of our products, it does not guarantee that rust will not form.</li> </ul>

Handling Lubricant	
 <b>Warning</b>	<p><b>Precautions on handling lubricants</b></p> <ul style="list-style-type: none"> <li>● Lubricant in the eye can cause inflammation. Wear protective glasses to prevent it from getting in your eye.</li> <li>● Lubricant coming in contact with the skin can cause inflammation. Wear protective gloves when you handle the lubricant to prevent it from contacting your skin.</li> <li>● Do not ingest (to avoid diarrhea and vomiting).</li> <li>● Use caution when opening the container. There may be sharp edges that can cut your hand. Wear protective gloves.</li> <li>● Keep lubricant out of reach of children.</li> </ul>
 <b>Caution</b>	<p><b>Disposal of waste oil and containers</b></p> <ul style="list-style-type: none"> <li>● Follow all applicable laws regarding waste disposal. Contact your distributor if you are unsure how to properly dispose of the material.</li> <li>● Do not apply pressure to an empty container. The container may explode.</li> <li>● Do not weld, heat, drill or cut the container. This may cause residual oil to ignite or cause an explosion.</li> </ul>
 <b>Warning</b>	<p><b>First-aid</b></p> <ul style="list-style-type: none"> <li>● Inhalation: Remove exposed person to fresh air if adverse effects are observed.</li> <li>● Ingestion: Seek immediate medical attention and do not induce vomiting unless directed by medical personnel.</li> <li>● Eyes: Flush immediately with water for at least 15 minutes. Get immediate medical attention.</li> <li>● Skin: Wash with soap and water. Get medical attention if irritation develops.</li> </ul>
 <b>Caution</b>	<p><b>Storage</b></p> <ul style="list-style-type: none"> <li>● Tightly seal the container after use. Store in a cool, dry, dark place. Keep away from open flames and high temperatures.</li> </ul>
 <b>Caution</b>	<p><b>Disposal</b></p> <p><b>Please dispose of as industrial waste.</b></p> <ul style="list-style-type: none"> <li>● Please dispose of the products as industrial waste when their useful life is over.</li> </ul>

# Experts in Precision Motion Control

## Other Products

### HarmonicDrive® Gearing

HarmonicDrive® speed reducer delivers precise motion control by utilizing the strain wave gearing principle.

### Rotary Actuators

High-torque actuators combine performance matched servomotors with HarmonicDrive® gears to deliver excellent dynamic control characteristics.

### Linear Actuators

Compact linear actuators combine a precision lead screw and HarmonicDrive® gear. Our versatile actuators deliver both ultra precise positioning and high torque.

### CSF Mini Gearheads

CSF mini gearheads provide high positioning accuracy in a super-compact package.
